

1/3-Inch CMOS Digital Image Sensor

MT9M021/MT9M031 Data Sheet

For the latest data sheet revision, refer to Aptina's Web site: www.aplina.com

Features

- Superior low-light performance
- HD video (720p60)
- Global shutter
- Video/Single Frame mode
- Flexible row-skip modes
- On-chip AE and statistics engine
- Parallel and serial output
- Support for external LED or flash
- Auto black level calibration
- Context switching

Applications

- Scene processing
- Scanning and machine vision
- 720p60 video applications

General Description

Aptina's MT9M021/MT9M031 is a 1/3-inch CMOS digital image sensor with an active-pixel array of 1280H x 960V. It includes sophisticated camera functions such as auto exposure control, windowing, scaling, row skip mode, and both video and single frame modes. It is designed for low light performance and features a global shutter for accurate capture of moving scenes. It is programmable through a simple two-wire serial interface. The MT9M021/MT9M031 produces extraordinarily clear, sharp digital pictures, and its ability to capture both continuous video and single frames makes it the perfect choice for a wide range of applications, including scanning and HD video.

Table 1: Key Parameters

Parameter	Typical Value
Optical format	1/3-inch (6 mm)
Active pixels	1280 x 960 = 1.2 Mp
Pixel size	3.75µm
Color filter array	RGB Bayer or Monochrome
Shutter type	Global shutter
Input clock range	6 – 50 MHz
Output pixel clock (maximum)	74.25 MHz
Output	Serial HiSPi (iBGA package only)
	Parallel 12-bit

General Description

The Aptina™ MT9M021/MT9M031 can be operated in its default mode or programmed for frame size, exposure, gain, and other parameters. The default mode output is a full-resolution image at 45 frames per second (fps). It outputs 12-bit raw data, using either the parallel or serial (HiSPi) output ports. The device may be operated in video (master) mode or in frame trigger mode.

FRAME_VALID and LINE_VALID signals are output on dedicated pins, along with a synchronized pixel clock. A dedicated FLASH pin can be programmed to control external LED or flash exposure illumination.

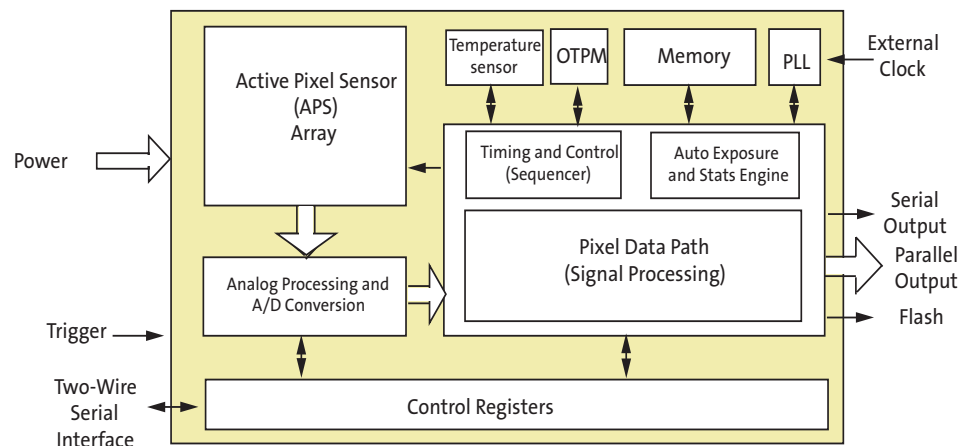

The MT9M021/MT9M031 includes additional features to allow application-specific tuning: windowing, adjustable auto-exposure control, auto black level correction, on-board temperature sensor, and row skip and digital binning modes.

The sensor is designed to operate in a wide temperature range (–30°C to +70°C).

Functional Overview

The MT9M021/MT9M031 is a progressive-scan sensor that generates a stream of pixel data at a constant frame rate. It uses an on-chip, phase-locked loop (PLL) that can be optionally enabled to generate all internal clocks from a single master input clock running between 6 and 50 MHz. The maximum output pixel rate is 74.25 Mp/s, corresponding to a clock rate of 74.25 MHz. Figure 1 shows a block diagram of the sensor.

Figure 1: Block Diagram

User interaction with the sensor is through the two-wire serial bus, which communicates with the array control, analog signal chain, and digital signal chain. The core of the sensor is a 1.2 Mp Active-Pixel Sensor array. The MT9M021/MT9M031 features global shutter technology for accurate capture of moving images. The exposure of the entire array is controlled by programming the integration time by register setting. All rows simultaneously integrate light prior to readout. Once a row has been read, the data from the columns is sequenced through an analog signal chain (providing offset correction and gain), and then through an analog-to-digital converter (ADC). The output from the ADC is a 12-bit value for each pixel in the array. The ADC output passes through a digital

processing signal chain (which provides further data path corrections and applies digital gain). The pixel data are output at a rate of up to 74.25 Mp/s, in parallel to frame and line synchronization signals.

Features Overview

The MT9M021/MT9M031 Global Sensor shutter has a wide array of features to enhance functionality and to increase versatility. A summary of features follows. Please refer to the MT9M021/MT9M031 Developer Guide for detailed feature descriptions, register settings, and tuning guidelines and recommendations.

- **Operating Modes**

The MT9M021/MT9M031 works in master (video), trigger (single frame), or Auto Trigger modes. In master mode, the sensor generates the integration and readout timing. In trigger mode, it accepts an external trigger to start exposure, then generates the exposure and readout timing. The exposure time is programmed through the two-wire serial interface for both modes.

Note: Trigger mode is not compatible with the HiSPi interface.

- **Window Control**

Configurable window size and blanking times allow a wide range of resolutions and frame rates. Digital binning and skipping modes are supported, as are vertical and horizontal mirror operations.

- **Context Switching**

Context switching may be used to rapidly switch between two sets of register values. Refer to the MT9M021/MT9M031 Developer Guide for a complete set of context switchable registers.

- **Gain**

The MT9M021/MT9M031 Global Shutter sensor can be configured for analog gain of up to 8x, and digital gain of up to 8x.

- **Automatic Exposure Control**

The integrated automatic exposure control may be used to ensure optimal settings of exposure and gain are computed and updated every other frame. Refer to the MT9M021/MT9M031 Developer Guide for more details.

- **HiSPi**

The MT9M021/MT9M031 Global Shutter image sensor supports two or three lanes of Streaming-SP or Packetized-SP protocols of Aptina's High-Speed Serial Pixel Interface.

- **PLL**

An on chip PLL provides reference clock flexibility and supports spread spectrum sources for improved EMI performance.

- **Reset**

The MT9M021/MT9M031 may be reset by a register write, or by a dedicated input pin.

- **Output Enable**

The MT9M021/MT9M031 output pins may be tri-stated using a dedicated output enable pin.

- **Temperature Sensor**

- **Black Level Correction**

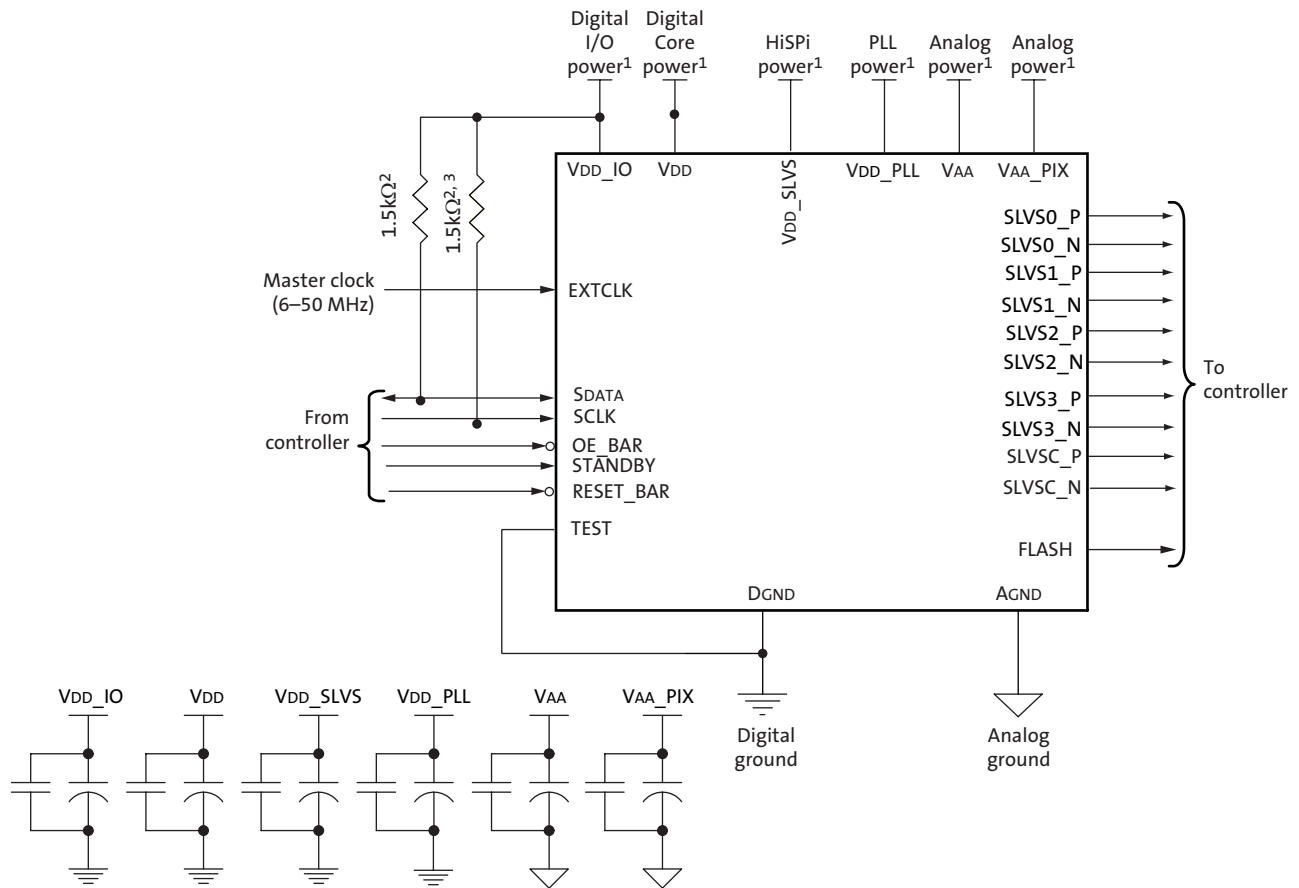

- **Row Noise Correction**

- **Column Correction**

- **Test Patterns**

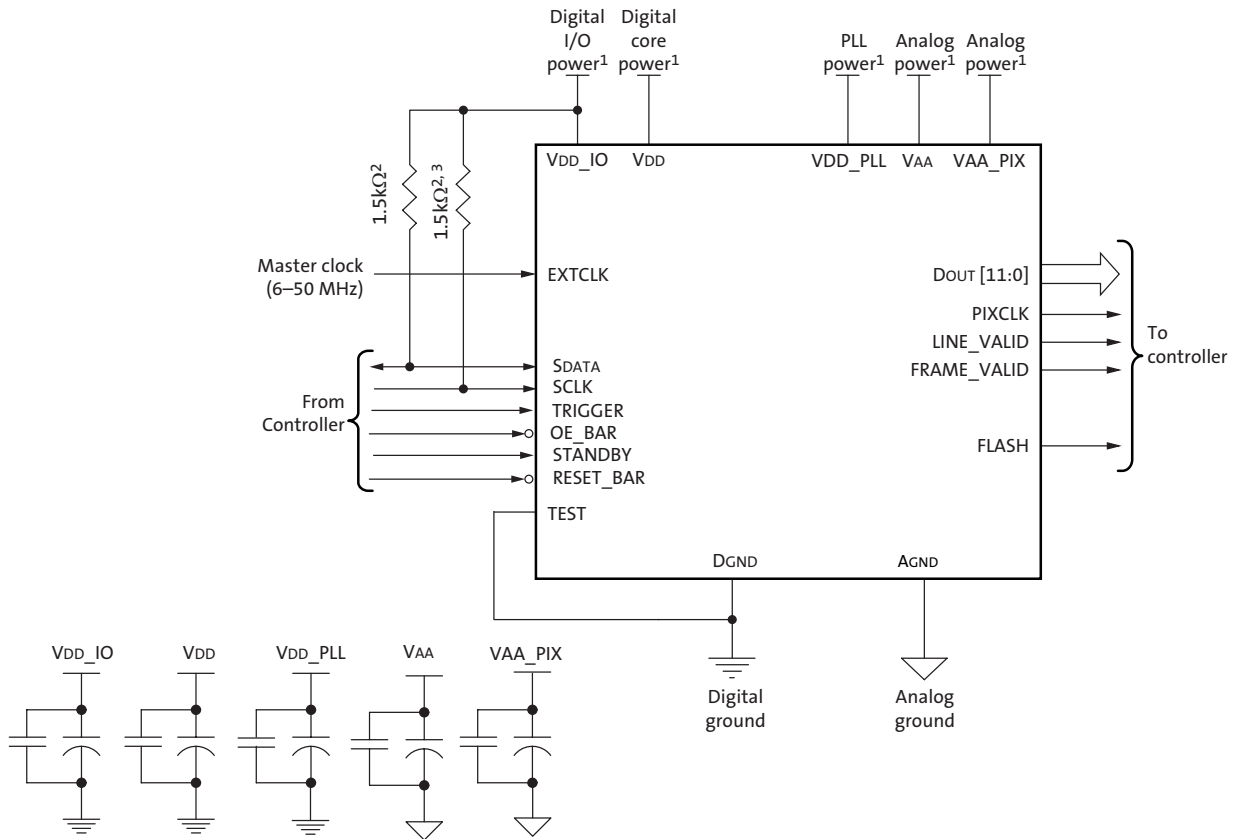

Several test patterns may be enabled for debug purposes. These include a solid color, color bar, fade to grey, and a walking 1s test pattern.

Figure 2: Typical Configuration: Serial Four-Lane HiSpi Interface

- Notes:
1. All power supplies must be adequately decoupled.
 2. Aptina recommends a resistor value of 1.5kΩ, but it may be greater for slower two-wire speed.
 3. This pull-up resistor is not required if the controller drives a valid logic level on SCLK at all times.
 4. The parallel interface output pads can be left unconnected if the serial output interface is used.
 5. Aptina recommends that 0.1μF and 10μF decoupling capacitors for each power supply are mounted as close as possible to the pad. Actual values and results may vary depending on layout and design considerations. Refer to the MT9M021/MT9M031 demo headboard schematics for circuit recommendations.
 6. Aptina recommends that analog power planes be placed in a manner such that coupling with the digital power planes is minimized.
 7. Although 4 serial lanes are shown, the MT9M021/MT9M031 supports only 2 or 3 lane HiSpi.

Figure 3: Typical Configuration: Parallel Pixel Data Interface

- Notes:
1. All power supplies must be adequately decoupled.
 2. Aptina recommends a resistor value of 1.5kΩ, but it may be greater for slower two-wire speed.
 3. This pull-up resistor is not required if the controller drives a valid logic level on SCLK at all times.
 4. The serial interface output pads can be left unconnected if the parallel output interface is used.

Electrical Specifications

Unless otherwise stated, the following specifications apply to the following conditions:

$V_{DD} = 1.8V - 0.10/+0.15$; $V_{DD_IO} = V_{DD_PLL} = V_{AA} = V_{AA_PIX} = 2.8V \pm 0.3V$;
 $V_{DD_SLVS} = 0.4V - 0.1/+0.2$; $T_A = -30^{\circ}C$ to $+70^{\circ}C$; output load = 10pF;
 PIXCLK frequency = 74.25 MHz; HiSPi off.

Two-Wire Serial Register Interface

The electrical characteristics of the two-wire serial register interface (SCLK, SDATA) are shown in Figure 6 and Table 5.

Figure 6: Two-Wire Serial Bus Timing Parameters

Note: Read sequence: For an 8-bit READ, read waveforms start after WRITE command and register address are issued.

**Table 5: Two-Wire Serial Bus Characteristics**

$f_{EXTCLK} = 27 \text{ MHz}$; $V_{DD} = 1.8\text{V}$; $V_{DD_IO} = 2.8\text{V}$; $V_{AA} = 2.8\text{V}$; $V_{AA_PIX} = 2.8\text{V}$;
 $V_{DD_PLL} = 2.8\text{V}$; $T_A = 25^\circ\text{C}$

- Notes:
1. This table is based on I²C standard (v2.1 January 2000). Philips Semiconductor.
 2. Two-wire control is I²C-compatible.
 3. All values referred to $V_{IHmin} = 0.9 V_{DD}$ and $V_{ILmax} = 0.1V_{DD}$ levels. Sensor EXCLK = 27 MHz.
 4. A device must internally provide a hold time of at least 300 ns for the SDATA signal to bridge the undefined region of the falling edge of SCLK.
 5. The maximum $t_{HD;DAT}$ has only to be met if the device does not stretch the LOW period (t_{LOW}) of the SCLK signal.
 6. A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement $t_{SU;DAT} \geq 250 \text{ ns}$ must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCLK signal. If such a device does stretch the LOW period of the SCLK signal, it must output the next data bit to the SDATA line $t_r \max + t_{SU;DAT} = 1000 + 250 = 1250 \text{ ns}$ (according to the Standard-mode I²C-bus specification) before the SCLK line is released.
 7. C_b = total capacitance of one bus line in pF.

I/O Timing

By default, the MT9M021/MT9M031 launches pixel data, FV and LV with the falling edge of PIXCLK. The expectation is that the user captures DOUT[11:0], FV and LV using the rising edge of PIXCLK. The launch edge of PIXCLK can be configured in register R0x3028.

See Figure 7 below and Table 6 on page 15 for I/O timing (AC) characteristics.

HiSPi Electrical Specifications

The Aptina MT9M021/MT9M031 sensor supports SLVS mode only, and does not have a DLL for timing adjustments. Refer to the High-Speed Serial Pixel (HiSPi) Interface Physical Layer Specification v2.00.00 for electrical definitions, specifications, and timing information. The VDD_SLVS supply in this datasheet corresponds to VDD_TX in the HiSPi Physical Layer Specification. Similarly, VDD is equivalent to VDD_HiSPi as referenced in the specification. The HiSPi transmitter electrical specifications are listed at 700 MHz.

Table 15: Input Voltage and Current (HiSPi Power Supply 0.4 V)

PHY-to-PHY Skew	t _{PHYSkew}			2.1	UI ^{1, 5}
Mean diferential skew	t _{DIFFSKEW}	-100		100	ps ⁶

- Notes:
1. One UI is defined as the normalized mean time between one edge and the following edge of the clock.
 2. Taken from 0V crossing point w/ DLL off.
 3. Also defined with a maximum loading capacitance of 10pF on any pin. The loading capacitance may also need to be less for higher bitrates so the rise and fall times do not exceed the maximum 0.3UI.
 4. The absolute mean skew between the Clock lane and any Data Lane in the same PHY between any edges.
 5. The absolute mean skew between any Clock in one PHY and any Data lane in any other PHY between any edges.
 6. Differential skew is defined as the skew between complementary outputs. It is measured as the absolute time between the two complementary edges at mean VCM point.

Power-On Reset and Standby Timing

Power-Up Sequence

The recommended power-up sequence for the MT9M021/MT9M031 is shown in Figure 11. The available power supplies (V_{DD_IO} , V_{DD} , V_{DD_SLVS} , V_{DD_PLL} , V_{AA} , V_{AA_PIX}) must have the separation specified below.

1. Turn on V_{DD_PLL} power supply.
2. After 0–10 μ s, turn on V_{AA} and V_{AA_PIX} power supply.
3. After 0–10 μ s, turn on V_{DD_IO} power supply.
4. After the last power supply is stable, enable EXTCLK.
5. Assert RESET_BAR for at least 1ms.
6. Wait 150000 EXTCLKs (for internal initialization into software standby).
7. Configure PLL, output, and image settings to desired values.
8. Wait 1ms for the PLL to lock.
9. Set streaming mode ($R0x301a[2] = 1$).

Figure 11: Power Up

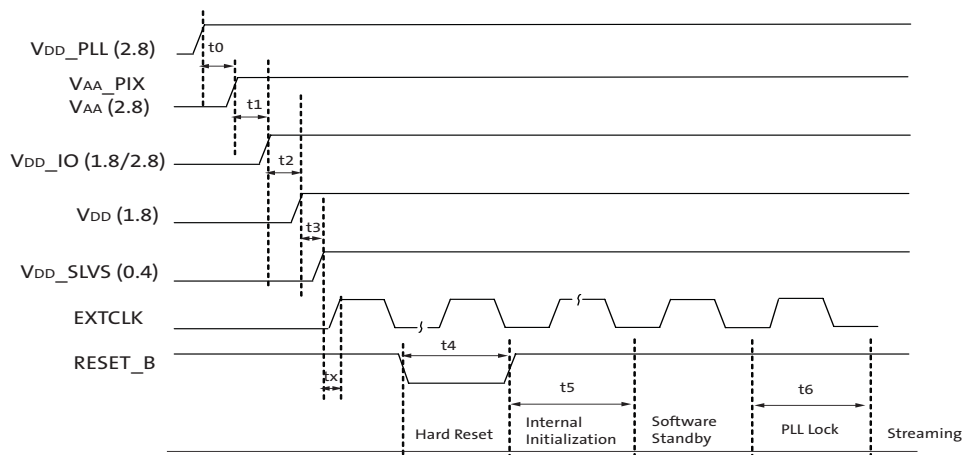

Table 17: Power-Up Sequence

Definition	Symbol	Minimum	Typical	Maximum	Unit
V_{DD_PLL} to V_{AA}/V_{AA_PIX}	t_0	0	10	–	μ s
V_{AA}/V_{AA_PIX} to V_{DD_IO}	t_1	0	10	–	μ s
V_{DD_IO} to V_{DD}	t_2	0	10	–	μ s
V_{DD} to V_{DD_SLVS}	t_3	0	10	–	μ s
Xtal settle time	t_x	–	30 ¹	–	ms
Hard Reset	t_4	1 ²	–	–	ms
Internal Initialization	t_5	150000	–	–	EXTCLKs
PLL Lock Time	t_6	1	–	–	ms

- Notes:
1. Xtal settling time is component-dependent, usually taking about 10 – 100 ms.
 2. Hard reset time is the minimum time required after power rails are settled. In a circuit where hard reset is held down by RC circuit, then the RC time must include the all power rail settle time and Xtal settle time.
 3. It is critical that V_{DD_PLL} is not powered up after the other power supplies. It must be powered before or at least at the same time as the others. If the case happens that V_{DD_PLL} is powered after other supplies then the sensor may have functionality issues and will experience high current draw on this supply.

Power-Down Sequence

The recommended power-down sequence for the MT9M021/MT9M031 is shown in Figure 12. The available power supplies (VDD_IO, VDD, VDD_SLVS, VDD_PLL, VAA, VAA_PIX) must have the separation specified below.

1. Disable streaming if output is active by setting standby R0x301a[2] = 0
2. The soft standby state is reached after the current row or frame, depending on configuration, has ended.
3. Turn off VDD_SLVS.
4. Turn off VDD.
5. Turn off VDD_IO
6. Turn off VAA/VAA_PIX.
7. Turn off VDD_PLL.

Figure 12: Power Down

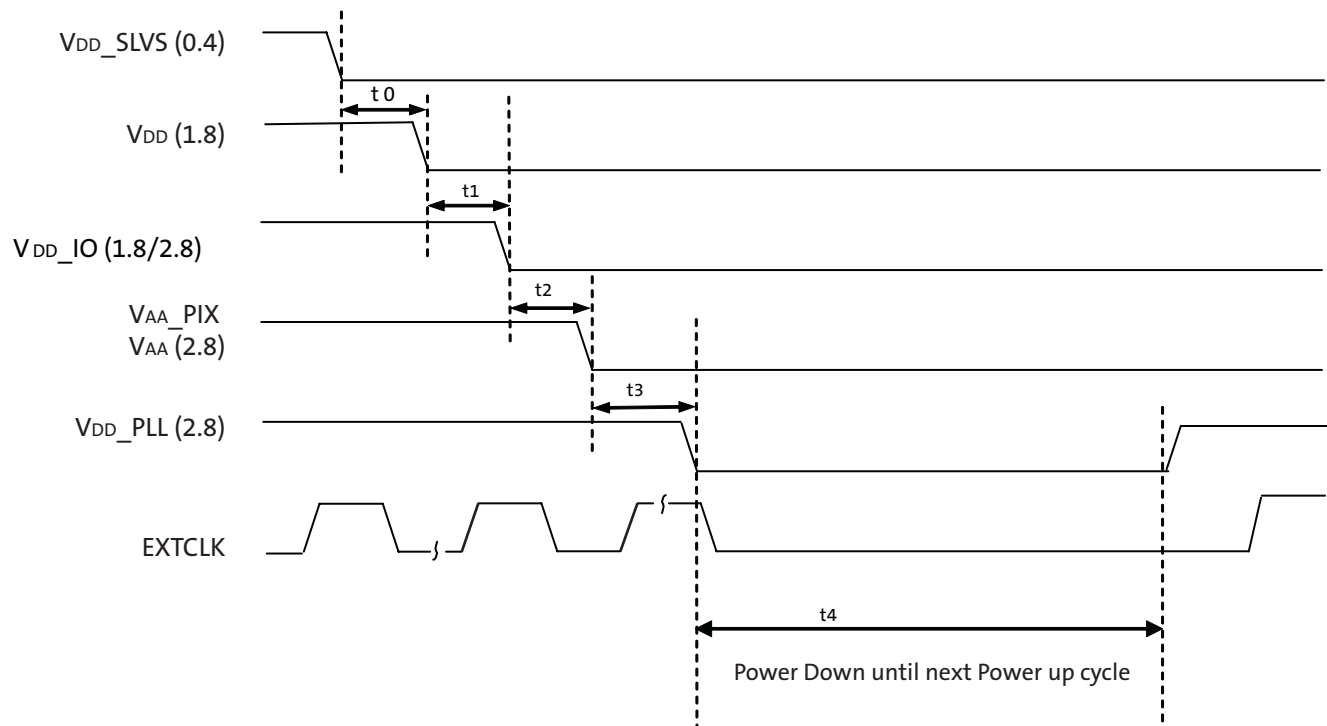

Table 18: Power-Down Sequence

Definition	Symbol	Minimum	Typical	Maximum	Unit
VDD_SLVS to VDD	t0	0	–	–	μS
VDD to VDD_IO	t1	0	–	–	μS
VDD_IO to VAA/VAA_PIX	t2	0	–	–	μS
VAA/VAA_PIX to VDD_PLL	t3	0	–	–	μS
PwrDn until Next PwrUp Time	t4	100	–	–	mS

Note: t4 is required between power down and next power up time; all decoupling caps from regulators must be completely discharged.

- Updated Table 17, “Power-Up Sequence,” on page 22
- Updated Figure 13: “Quantum Efficiency – Monochrome Sensor,” on page 24

Rev. B11/16/09

- Updated the following parameters in Table 1, “Key Parameters,” on page 1
 - input clock range
 - responsivity
 - dynamic range
- Updated Table 2, “Available Part Numbers,” on page 1
- Replaced “scaling” with “digital binning” in third paragraph of “General Description” on page 5
- Updated master clock range in Figure 2 on page 7 and Figure 3 on page 8
- Updated number of rows in first sentence of first paragraph in “Pixel Array Structure” on page 10
- Updated array pixel coordinates in Figure 6 on page 12
- Added “Default Readout Order” on page 12
- Updated “Output Data Format” on page 13
- Added “Readout Sequence” on page 13
- Replaced “Parallel Data Timing” section with “Parallel Output Data Timing” on page 14
- Moved Figure 13, Line Timing and FRAME_VALID/LINE_VALID Signals and Table 5, Frame Time: Long Integration Time to new section “Frame Time” on page 17; added Table 4, “Frame Time (Example Based on 1280 x 960, 45 Frames Per Second),” on page 17
- Updated first paragraph of “Real-Time Context Switching” on page 19
- Updated Table 6, “Real-Time Context-Switchable Registers,” on page 19
- Updated “Features” section as follows:
 - Updated “Trigger Mode” on page 20
 - Moved “Hard Reset of Logic” and Soft Reset of Logic” to “Reset” on page 21
 - Added “Readout Modes” on page 25; “Mirror” on page 27, “Maintaining a Constant Frame Rate” on page 28, “Synchronizing Register Writes to Frame Boundaries” on page 28; “Restart” on page 29, “Automatic Exposure Control” on page 29, and “Test Patterns” on page 32
 - Deleted “Pixel Integration Control,” “Pixel Clock Speed,” “Statistics and Settings Readout,” “Read Mode Options,” and “Line_Valid”

- Updated “Electrical Specifications” on page 13
- Moved “Power-On Reset and Standby Timing” on page 22 from appendix to main body of document
- Replaced Figure 13: “Quantum Efficiency – Monochrome Sensor,” on page 24 with placeholder
